Database Design - E-commerce Store

Integrity notes

Prices use Decimal (no float drift); order items keep a price/name snapshot; Product/Order/Payment use PROTECT or soft-delete so history is never lost; UNIQUE(user, idempotency_key) makes checkout retry-safe; UNIQUE(cart, product) means one cart line per product (size/color stored on the line); stock changes use SELECT ... FOR UPDATE row locks. Known gaps: no CHECK(price>=0) (D-09), size-level stock lives inside JSON (no FK/constraint). Full DDL: schema.sql (derived from the models; verify with sqlmigrate / pg_dump).
